

iOra for Microsoft SharePoint Server 2007

In today's highly competitive global markets, distributed organizations need to automate the processes for sharing information between employees, customers and partners. Centrally implemented Microsoft Office SharePoint Server 2007 defines the new standard for enterprise collaboration. iOra extends Microsoft SharePoint functionality to the users on the edges of organizations, by making the same rich interfaces available independently of bandwidth speeds or network connectivity.

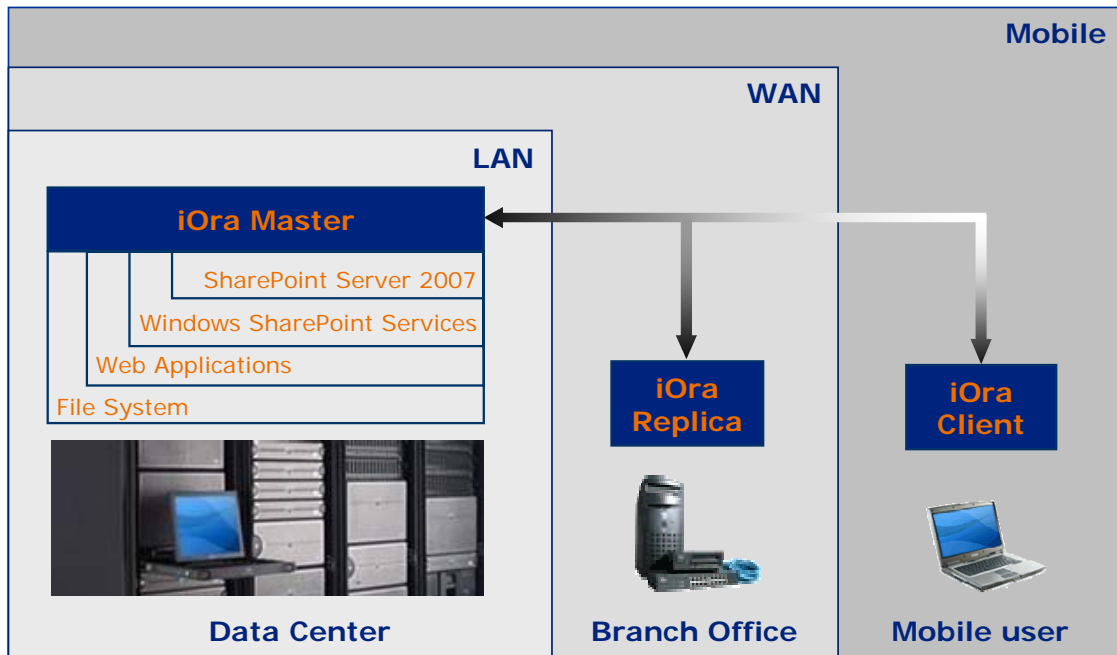

- **iOra Accelerator for SharePoint:** enables read-only or writable replicas of portal content to be efficiently and securely replicated between servers.
- **iOra ON (Offline Networking) for SharePoint:** allows laptop users to continue to use the same rich SharePoint functionality even when they have no network connection.

Why iOra is recognized as the most advanced product in its class:

- **Performance:** Providing LAN response times for WAN users means response times in access of 1 minute for opening large documents can be reduced to less than 5 seconds.
- **Cost reduction:** Using iOra's unique Epsilon compression technology, and scheduled replication, peak WAN bandwidth utilization for SharePoint can be reduced by 90%.
- **Security:** iOra integrates with the existing SharePoint and Windows security infrastructure to guarantee the same level of security at remote sites or when offline.
- **Availability:** Supports offline access to replicated content on laptops or on remote servers.
- **Scalability:** Supports tens of thousands of users and terabytes of replicated content.
- **Transparency:** Whether online, offline or remote the end user experience is the same, so avoiding costly re-training of users, or changing SharePoint on the master server.
- **Compatibility:** iOra's integration with SharePoint and Web Virtualization technology means that in addition to SharePoint portal and team sites, web parts linked to other web applications (e.g. ASP .Net), can also be replicated. In addition, iOra supports any network type from low bandwidth dial up to wide area networks that use intermittent satellite connections.

Example customers:

- **Military:** US Navy use iOra to keep their Distance Support SharePoint portal continuously updated over high latency networks across the entire fleet.
- **Commercial:** Capgemini have implemented iOra to ensure their consulting team sites are kept constantly available on their laptops when online or offline.
- **Maritime:** iOra's patented Epsilon compression has enabled BP to reduce the satellite cost of keeping health and safety information up to date on oil tankers by 97%.

Software Components include:

- **iOra Publisher:** Used on the Master and Replica servers to create, update and manage replicated content. Supports Windows 2000 and above.
- **iOra Client:** Used on the Master and Replica servers to make replicated content available transparently to local users. Supports Windows 2000 and above.
- **iOra SharePoint Extensions:** Used on all machines to provide SharePoint specific functionality.

Product Features:

- **Epsilon compression:** Reduces network utilization for updates by up to 100X.
- **Two way replication:** Bi-directional replication between servers and clients with conflict detection and resolution of independent updates.
- **Offline search:** Transparent offline support for advanced SharePoint search.
- **Personalization:** Enables individual users to take personal content offline.
- **Audit:** Central audit reports on the state of all replicated content on all machines.
- **Transactional updates:** Updates applied transactional to guarantee data integrity.

iOra provides accelerated access to web applications and replicates web and file-based content to remote servers and laptops, using a fraction of network bandwidth.
